1. PERFORMANCE CHECK PROCEDURE

1-1. GENERAL

This section contains the Procedures required to check and maintain specified instrument performance. The adjustments should be performed at an ambient temperature of $23^{\circ}\text{C} \pm 5^{\circ}\text{C}$ and a relative humidity of less than 60%. It allows the instrument to stabilize at this environment for a minimum of 30 minutes.

1-2. EQUIPMENT'S REQUIRED

Table 1-1 is shown test equipment's required.

Table 1-1 Equipment's required

No.	Equipment name	Specification	Remark
1.	10MHz SIGNAL SOURCE	10MHz STANDARD	
2.	TEST OSCILLATOR	0.1Hz to 30MHz	
2.	RF SIGNAL GENERATOR	100kHz to 3.7 GHz	
3.	50-ohm TERMINATION	100MHz BANDWIDTH	
4.	D.M.M.		
5.	OSCILLOSCOPE	V: 5mV H:50ns	

1-3. PERFORMANCE CHECK

1-3-1. FREQUENCY RESPONSE AND SENSITIVITY

A. INPUT A

SPECIFICATION :

- Frequency Range ; 0.1Hz to 100MHz(DC Coupled),30Hz to 100MHz(AC Coupled)
- Sensitivity ; 30mVrms (0.1Hz to 100MHz)

1. Set the front panel controls as follows;

- FUNCTION : FREQ. A
- GATE TIME : 1S
- ATTN.(A) : 1/1 (PULL OUT)
- COUPLE(A) : DC (PULL OUT)

2. Connect the Test Oscillator to INPUT A with a BNC cable.

3. Vary the out-put frequency of Test Oscillator from 0.1Hz to 10MHz, maintaining a 30mVrms signal level and check the counter display the correct frequencies.

4. Connect the RF Signal Generator to INPUT A with a BNC cable and 50Ω feed through.

5. Vary the out-put frequency of RF Signal Generator from 10MHz to 100MHz, maintaining a 30mVrms signal level and check the counter display the correct frequencies.

B. INPUT C

SPECIFICATION :

Frequency Range	Sensitivity
80MHz – 3.5GHz	10mVrms from 80 MHz to 2.0GHz 20mVrms from 2.0GHz to 3.0GHz 30mVrms from 3.0GHz to 3.2GHz 40mVrms from 3.2GHz to 3.5GHz 70mVrms from 3.5GHz to 3.7GHz

1. Set the front panel controls as follows:
 - FUNCTION : FREQ. C
 - GATE TIME : 1S
2. Connect the RF Signal Generator to INPUT C with a BNC(with N-to-BNC Adaptor)cable.
3. Vary the out-put frequency of RF Signal Generator from 80MHz to 2000MHz, maintaining a 10mVrms signal level and check the counter display the correct frequencies.
4. Vary the out-put frequency of RF Signal Generator from 2.0GHz to 3.0GHz, maintaining a 20mVrms signal level and check the counter display the correct frequencies.
5. Vary the out-put frequency of RF Signal Generator from 3.0GHz to 3.2GHz, maintaining a 30mVrms signal level and check the counter display the correct frequencies.
6. Vary the out-put frequency of RF Signal Generator from 3.2GHz to 3.5GHz, maintaining a 40mVrms signal level and check the counter display the correct frequencies.
7. Vary the out-put frequency of RF Signal Generator from 3.5GHz to 3.7GHz, maintaining a 70mVrms signal level and check the counter display the correct frequencies.

1-3-2. PERIOD

SPECIFICATION ; 10 nS to 10 S

1. Repeat step 1-3-1. A 1. Set the function to PERIOD A.
2. Connect the Test Oscillator to INPUT A with a BNC cable.
3. Vary the out-put frequency of Test Oscillator from 0.1Hz to 10MHz, maintaining a 30mVrms signal level and check the counter display the correct period of all frequencies in specified range.
4. Connect the RF Signal Generator to INPUT A with a BNC cable and 50Ω feed through.
5. Vary the out-put frequency of Signal Generator from 10MHz to 100MHz, maintaining a 30mVrms signal level and check the counter display the correct period of all frequencies in specified range.

1-3-3. TOTALIZE

SPECIFICATION :

10Hz to 30 MHz, 30mVrms

1. Set the front panel controls as follows;

- FUNCTION : TOTAL A
- HOLD : NORM(PULL OUT)
- ATTN.(A) : 1/1 (PULL OUT)
- COUPLE(A) : DC (PULL OUT)

The totalize mode is used to count the total number of events occurring during a specific time period. Maximum frequency is 30 MHz.

- a. Set the totalize mode. Any gate and units setting is ignored.
- b. Apply the signal to be measured to input A, and then the counter display is the count continually. Maximum count is 999999999. If this is exceed the overflow message display as "OF"
- c. Low pass filter and attenuator, coupling switch application is same as frequency measurements mode.

NOTE

THE HOLD SWITCH MAY BE USED TO BE LATCH THE DISPLAY. HOWEVER, THE COUNTER TO INCREMENT AND WHEN THE HOLD IS RELEASED, THE UPDATE COUNT IS DISPLAY.

1-3-4. RPM (Rotation Per Minute)

SPECIFICATION ; 600 to 600 x 10⁶ RPM , OVER FLOW : "OF"

1. Set the front panel controls as follows;

- FUNCTION : RPM A
- HOLD : NORM(PULL OUT)
- ATTN.(A) : 1/1 (PULL OUT)
- COUPLE(A) : DC (PULL OUT)

- a. Set the RPM mode. Any gate time and units setting is ignored
- b. Apply the signal to be measured to the input A BNC, and then the counter displays the RPM. Maximum count is 999999999. If this is exceed, the overflow message displays as "OF"
- c. Low pass filter and attenuator, coupling switch application is same as frequency measurements mode.

2. ADJUSTMENT PROCEDURE

2-1. PRELIMINARY SET-UP

Remove top cover and top shield case.

Apply power, and allow at least 30 minutes for warm-up.

2-2. POWER SUPPLY

- a. Check the voltage in each position according to table 2-1.

Table 2-1 Power supply outputs

Check position	Supplying Voltage	Tolerance	Remark
U16 OUT-PUT	+ 5 V	$\pm 0.5V$	
U17 OUT-PUT	+ 5 V	$\pm 0.5V$	

2-3. TIME BASE FREQUENCY ADJUSTMENT

NOTE ; If this adjustment is to be considered valid, the unit should have a half-hour warm-up and the line voltage should be within $\pm 5\%$.

2-3-1. Method #1

1. Apply an external signal of known frequency(10MHz standard signal) and suitable amplitude(minimum 30mVrms) to Input A terminal.

2. Set the front panel controls as follows ;

- FUNCTION : FREQ. A
- GATE TIME : 1S
- ATTN.(A) : 1/1 (PULL OUT)
- COUPLE(A) : DC (PULL OUT)

The approximate input frequency should be in the display with an update once a second.

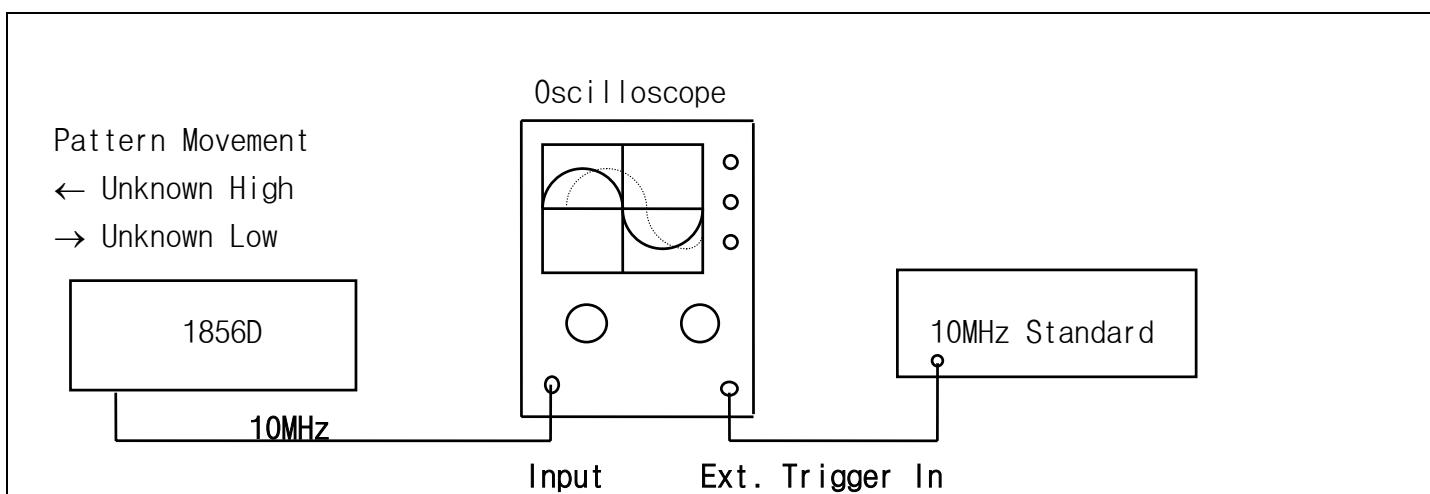

3. Adjust “TC0” slowly until the display shows the input frequency by using a plastic tuning wand.

2-3-2. Method #2

This method accomplishes a more accurate adjustment of the time base frequency than Method #1.

1. Connect an Oscilloscope to Internal Oscillator(10MHz) Out-put terminal on rear panel .
2. Connect a 10MHz Standard Signal to the EXT trigger input of Oscilloscope. Refer to the diagram below.

Every few months, the oscillator should be checked to a standard signal. When adjustment is required, use the oscilloscope method shown. Using the appropriate sweep speed, adjust the oscillator until the movement of the pattern(wave form) is stopped.

3. Set the controls of the oscilloscope as follows;
 - Coupling : AC
 - Input Impedance : 1 Mohm
 - Hor. Trigger : EXT.
 - Time Base : 0.1 uS/div
4. Adjust Vertical Gain for a full screen waveform. The waveform should be moving either to the left or to the right.
5. Adjust "TC0" until the waveform is stationary. The accuracy of frequency adjustment can be determined by referring the following table.

Table 2-1. Time Base Adjustment

Movement	SWEEP SPEED			NOTES
	1uS/cm	0.1uS/cm	0.01uS/cm	
1 cm/S	1×10^{-6}	1×10^{-7}	1×10^{-8}	Time scope trace
1 cm/10 S	1×10^{-7}	1×10^{-8}	-	movement with
1 cm/100 S	1×10^{-8}	-	-	Second hand or Watch or Clock

2-4. INPUT SENSITIVITY ADJUSTMENT

2-4-1. INPUT A

SPECIFICATION :

- Frequency Range ; 0.1Hz to 100MHz(DC Coupled)
 30Hz to 100MHz(AC Coupled)
- Sensitivity ; 30mVrms (0.1Hz to 100MHz)

1. Set the front panel controls as follows;

- FUNCTION : FREQ. A
- GATE TIME : 1S
- ATTN.(A) : 1/1 (PULL OUT)
- COUPLE(A) : DC (PULL OUT)

2. Connect the Test Oscillator to INPUT A with a BNC cable.

3. Set the out-put frequency of Test Oscillator to 100kHz , 10mVrms and adjust "SFR1" for displaying the correct frequency.

4. Check Minimum input voltage from 0.1Hz to 100MHz according to the performance check step "1-3-1. A".

3. Troubleshooting Procedure

3-1. Troubleshooting techniques

3-1-1. Check the function selector and switch setting. Incorrect switch settings can give a false indication of instrument malfunction. If there is any question about the correct function or operation, Refer to OPERATOR'S MANUAL.

3-1-2. Check associated equipment's

Before proceeding, ensure that any equipment's used with Frequency counter is operating correctly and verify that out and input signals are properly connected and that the interconnecting cables are not defective.

3-1-3. Visual Check

Look for broken terminals, damaged components, mounting status of components, damaged circuit boards, or other clues to the cause of a malfunction.

3-2. Troubleshooting procedure

3-2-1. NO Display

1. Check the “FUSE” and if it is broken, change to new one with same rating.
2. Check the output voltage of power transformer.
 - . 6 to 8 Vac between pin 1 and 2 of CN7, and between pin 2 and 3 of CN7 on main board.
 - . 6 to 8 Vac between pin 1 and 2 of CN13, and between pin 2 and 3 of CN13 on main board.
3. Check the DC Power Voltage.
 - . +5VDC at U16 output
 - . +5VDC at U17 output
4. Check the frequency at pin 19 of U11. It should be “11.0592MHz”.
5. Check the DC Power voltage of Counter Circuit, Micro-processor, Driver, Buffer, Scanner (U1,2,3,4,5,6,8,9,10,11,12,13,NU20)
6. Check the connector cable from CN4', 4-1'(main board) to display board(CN4,CN4-1).
7. Check the operation of Display controller(U12,U13) on main board.

3-2-2. INPUT A

1. Check the input coaxial(1P shield wire) cable connection.
2. Check the Input Attenuator switch operation.
3. Connect 1MHz , 50mVrms sine wave signal to Input A and check the frequency and waveform at Q2 Emitter. The amplified 1MHz Sine wave should appeared.
4. If not, check the operation of Impedance Converter(Q1,Q2,D3,D4) .
5. Check the frequency and wavefore at Q4 Collector. The amplified 1MHz Square wave should appeared.
6. If not, check the operation of ECL Amplifier and TTL Converter(U1, Q3, Q4) .
7. Check the frequency at Pin 2 of U3. It should be “10.0000 MHz”. If not, check the operation of Time Base Circuit(TC0, Q18, Q19).
8. Check the Waveform at Pin 1 of U3. The burst Signal should be appeared.
If not, check the operation of Input Controller(U3).
9. Check the operation of Counter Circuit, Micro-processor(U11), Driver(U4,5) , Buffer(U9) , BUS(U6,7) , Scanner(U12,13) , Display Driver(U10) .
10. Connect 10MHz , 50mVrms sine wave signal to Input A and check the frequency and waveform at Pin 6 of U2. The 1.25MHz Square wave signal should be appeared.
If not,check the operation of 1/8 Divider(U2) .

3-2-3. INPUT C

--- PRESCALER PCB PART ---

1. Check the input cable connection(NJ'-4P shield wire, Main-Prescaler).
2. Check the DC Power voltage of Prescaler Circuit pin 6 of U1, pin 6 of U4, Pin 2 of U3,NJ1-1(4P shield wire pin1 –Red wire) : +5Vdc($\pm 0.5V$) .
3. Check the DC voltage of Prescaler Circuit
pin1 of U4 : 1.06V , pin4 of U4 : 4.35V , pin6 of U4 : 1.06V.
pin1 of U1 : 1.06V , pin4 of U1 : 4.35V , pin6 of U1 : 1.06V. pin1 of U2 : 0.64V
pin2 of U3 : 4.96V , pin4 of U3 : 2.94V , pin8 of U3 : 2.68V
4. If not, check the operation of U1,2,3,4 and D6 .
5. Connect 100MHz , 50mVrms sine wave signal to Input C and check the frequency at Pin 4 of U3(Main-Prescaler). The “0.390625 MHz” should appeared.
6. If not, check the operation of 1/256 Divider(U5).
7. Check the Waveform at Pin 1 of U3(main-board). The “0.390625 MHz” should appeared.If not, check the operation of Input Controller(U3-main).
8. Check the operation of Counter Circuit, Micro-processor(U11), Driver(U4,5), Buffer(U9), BUS(U6,7), Scanner(U12,13), Display Driver(U10).

--- MAIN PCB PART ---

1. Check the DC Power voltage of Main Circuit pin 14 of NU20, anode of ND15.
2. Connect 100MHz , 50mVrms sine wave signal to Input C and check the frequency at Collector of NQ101(main-board) ,pin3 of NU20(main-board), pin5 of U3. The “0.390625 MHz” should appeared.
3. If not, check the operation of NQ101,NU20.
4. Repeat Step 3-2-3. 7 to 8.

3-2-4. Function Selector(Period,Total)

1. Check the switch operation.
2. Check Diode D9, D10.
3. Check the operation of U12 and U11.

3-2-5. Gate Time

1. Check the switch operation.
2. Check Diode D11,Q7.
3. Check the operation of U12 and U11.

3-2-6. EXT/INT Reference Signal

1. Check the Switch operation and Cable connection from switch to main board.
2. Set to INT and check the out frequency at BNC terminal.
3. If not, check the operation of TCO circuit and cable connection.
4. Set the switch to EXT and connect 10MHz Standard Signal to BNC terminal.
5. Check the frequency at Pin2 of U3. The 10MHz signal from external standard should be appeared.
6. If not, check the operation of Time Base Circuits(Q18,19) and cable connection.

4. PARTS LIST
